

JAYLINE CLASSIC/MAGIC

Regarded as one of the world's top quality wood burners, this heater has recently excelled in emission tests. New technology resulting in higher combustion temperatures and combustion of unburnt gases makes this one of the most efficient units on the market today.

JAYLINE JUNIOR

Initially designed for smaller homes, the Junior is rapidly establishing a reputation for excellent performance in medium and larger homes as well. The adaptation of the heat exchanger tube system of larger models, coupled with double burning features, has been credited for the Junior's excellent efficiency.

JAYLINE UKAI

Designed for the larger open plan home, this heater will produce 24kw, take logs of up to 1/2 metre in length, and gives low burn times in excess of 12 hours. The Ukai has achieved a style to suit the most demanding decor.

JAYLINE INBUILT CLASSIC/MAGIC

Tested to comply with zero clearance (timber to chimney) bylaws, this heater is ideal for installation in situations where the clearance between the timber frame and chimney masonry is not known.

The Jayline Inbuilts use the same fire box principles as the freestanding units and are capable of achieving an air volume circulation comparable to many fan assisted heaters.

FEATURES

5 Year Warranty

Brick Lined Firebox

Overnight Burning

Large glass door on all Models

Unique Doorlatch

Single Heat Control

Anti-spill Doorlip

Removable top for cooking and easy cleaning

Non-metal Baffle for "Cleaner Burning"

Continuous flow secondary air for "Double Burning"

Heat Exchanger Tubes warm air throughout the entire fire box for extra heat

Wetback optional on all models

All fireboxes ceramic lined, fully welded steel

BE GREEN, BURN CLEAN.

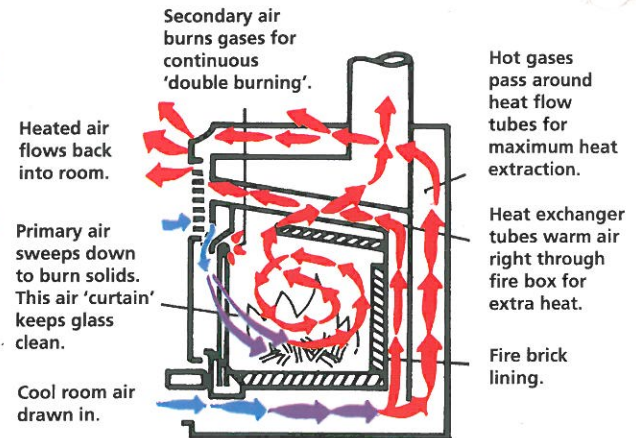

The cosy warmth of a log fire is a traditional winter comfort. Today, new manufacturing techniques and careful study of the efficiency of solid fuel heaters has led to a new generation of wood burning fires that conserve fuel and yet are highly efficient.

Jayline have been making wood fires for more than 20 years and have always placed particular emphasis on the need for its products to be conservation-friendly and as clean burning as possible.

The quest for this super efficiency in the fires has also led to other major features on the stoves.

Jayline fires were the first to incorporate ceramic fire technology with a unique heat exchanger system and were the first New Zealand products to receive an efficiency rating above 80 per cent from a Telarc laboratory, the most highly regarded building products testing authority in New Zealand.

In a recent test by an Australian laboratory, the Jayline fires proved to be one of the most efficient in the low, medium and high temperature settings. This was achieved through a superior design, which allows for the widest range of woodburning conditions.
